

Interdisciplinary Approaches for Total Communication within Disability Settings (O11)

Output 11 comprises a selection of documents contributed by researchers who participated in the Project International Conference and Multiplier Event, December 2017. These contributions have been selected by the scientific committee after a peer review process and they address important issues related to the EC+Project.

There are four different blocks:

The first one, dedicated to intervention and communication, contains two chapters. The first addresses the topic of natural gestures for communication within the group of people suffering severe intellectual disability and a second is dedicated to the communication with people suffering from Angelman syndrome.

The second block contains two chapters. The first one deals with the opportunities of ICT tools for communication and the second one with the specific application created by EC+ Project and its use for the intervention of people suffering profound intellectual disability.

The third block includes terminological resources for interpreters with a database for afasia in the first chapter and a multilingual glossary for the 15 syndromes studied in the EC+ Project in the second chapter.

The fourth block contains two resources on multimodality approaches for deaf people using pictograms.

The last chapter is dedicated to legal and social aspects of disability and the present challenges.
